Educare Point Change Report

What changed, why it was needed, and how the behavior works now

Summary

This report covers the code review fixes and checkout changes made from your screenshots. Checkout now separates product amounts from shop-confirmed service costs.

Review fixes

1. Safer order totals and status

Why: A browser can be changed before an order is submitted.

Before: The server trusted submitted totals and extra order fields.

After: The server calculates product prices from its catalog, accepts known fields, and starts new orders as pending.

2. Private order lookup

Why: A phone number alone should not expose every order.

Before: Lookup could return multiple orders and extra private details.

After: Customers must provide phone number and full order ID; lookup returns one order with limited details.

3. Payment proof checks

Why: Payment screenshots should belong to the customer and order.

Before: The upload did not fully verify ownership or payment state.

After: The server checks phone, order ID, payment method, pending status, and image type.

4. Stock reservation

Why: Two orders at once could oversell stock.

Before: Stock could be reduced without checking availability or restored on save failure.

After: Stock is reserved only when available and restored if saving the order fails.

5. Upload and download protection

Why: File extension alone does not prove a file is safe.

Before: Customer files and product images shared a public upload route; download tokens appeared in URLs.

After: Uploads have separate permissions and file checks. Admin download tokens use an authorization header, and redirects are rejected.

6. Product and API reliability

Why: Hidden items, repeated requests, and missing setup could cause errors or abuse.

Before: Price sorting was text-based, inactive items could be fetched directly, and request limits/setup checks were missing.

After: Prices sort numerically, direct lookup only returns active products, routes have rate limits, and required server settings are documented and checked.

Checkout changes from your screenshots

7. Service price confirmed at the shop

Why: Printing cost can depend on the document and actual ink coverage.

Before: The service page displayed rates and confirmation showed a combined amount, such as INR 76 including an estimated print charge.

After: Online service rates and calculated service totals are removed. Service cost says Confirmed at the shop; selected products appear as a separate subtotal.

8. Pickup only; home delivery coming soon

Why: Home delivery is not currently available.

Before: Pickup and home delivery could both be selected, with an address and delivery charge.

After: Pickup is the only active method. Home Delivery is marked Coming soon in service and product checkout; the server accepts pickup only for new orders.

Checkout changes (continued)

9. Cash on pickup only

Why: UPI checkout is not ready to accept customer payments.

Before: UPI and cash were both selectable, including a QR and screenshot flow.

After: UPI is marked Coming soon and cannot be selected. Cash on Pickup is the active option; the server rejects new UPI orders.

10. Clear confirmation and admin details

Why: A combined amount can look final while the shop still needs to confirm service cost.

Before: The confirmation showed one total for products and service together.

After: Service orders show the product subtotal separately, when applicable, and Service cost: Confirmed at shop. Admin and order history show the same distinction. Product-only orders continue to show their product total.

Important notes

No automatic ink measurement: The app does not analyze ink coverage or calculate a surcharge. The shop checks the document and tells the customer the service price before printing.

Deployment setup: Set the required server environment values listed in `server/.env.example` before deployment.

Verification: The React production build completed successfully. Changed server files passed JavaScript syntax checks, and `git diff --check` passed. Application tests were not run.

Files changed include checkout and service pages, order history and admin screens, order validation and pricing, upload and download routes, authentication, API rate limiting, and project setup notes.
